The program starts all teams with an equal arbitrary value and then
adjusts them all recursively based on game scores until the lowest cumulative
error between expected goal differentials and actual goal differentials is
reached (convergence).   One effect often noticed is that a team's rating can
change slightly without playing due to previous opponents playing which affects
their rating and their opponent's rating, etc.

The Total column is in goal units and the difference in this value between
any two teams is the predicted goal differential for a game played at a
neutral site between those two teams.

It should be noted that these rankings are an average performance value
for each team for the entire season, all games are equally weighted, so a team's
latest game may make up only 1/40th of a teams rating at the end of the season.

Games that go to shootouts for decision are considered ties for ratings purposes.

Currently, teams with as few as 3 scores are ranked. The more games that go
into a team's ranking, the more accurate their ranking will be.
